

What's New in mobilEcho 3.7?

Introducing mobilEcho for Good Dynamics

GroupLogic's mobilEcho solution is the industry's first Mobile File Management (MFM) software which enables enterprise IT to provide secure mobile access to enterprise file servers and storage for their enterprise mobility users (iPad, iPhone, etc.).

mobilEcho gives IT organizations a solid foundation for their Mobile File Management (MFM) strategy. With the simplicity demanded by end users, and the security and management required by enterprises, mobilEcho encompasses a number of key features that drive value for the enterprise, including:

1. Users can access, browse, preview, edit and search files on corporate file servers (Windows, Linux, Mac) and NAS storage devices all within the secure mobilEcho "sandbox".
2. Active Directory integration for authentication and ease of deployment.
3. Secure PDF preview and annotation within the mobilEcho app meets corporate security, compliance and governance standards.
4. mobilEcho's Client Management system gives enterprises the flexibility to decide the best policies for their organization. Many of the features are configurable by IT administrators to ensure alignment with corporate governance, compliance and security needs.
5. With one-way and two-way syncing, business units can keep employees up to date with the latest materials (such as sales presentations, data sheets, product docs, etc.).

And many more critical end-user and enterprise features.

Now, GroupLogic and Good Technology have partnered to bring mobilEcho's secure Mobile File Management to the Good Dynamics platform. This allows mobilEcho to take advantage of Good Dynamics' secure communications, secure storage, and remote application management capabilities.

SECURED BY GOOD DYNAMICS

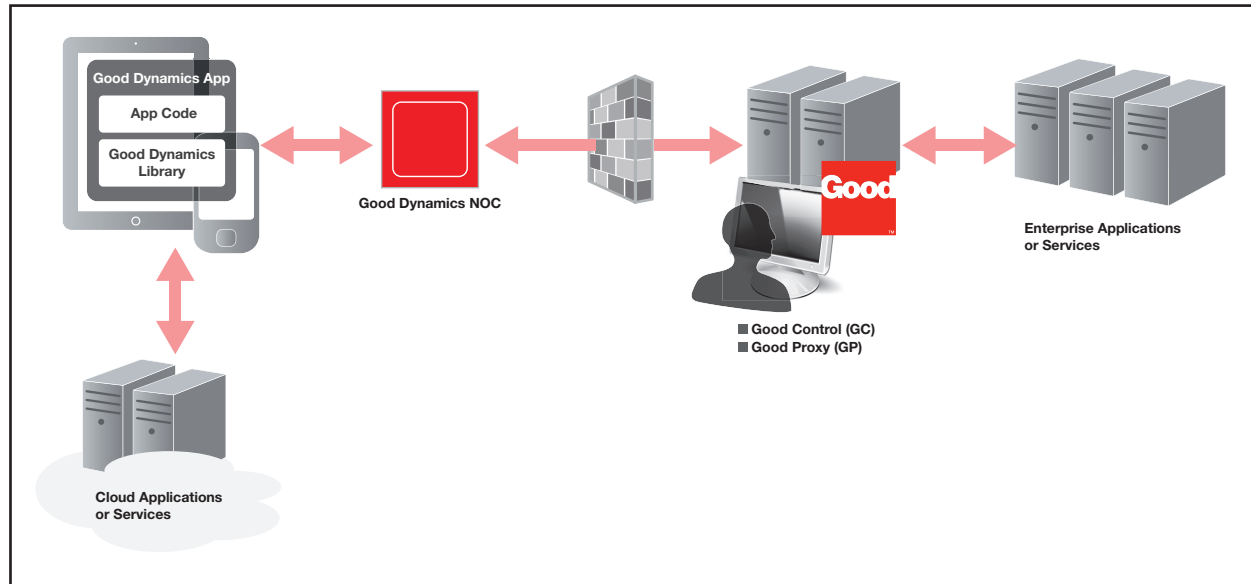

mobilEcho for Good Dynamics is a secure, mobile file management (MFM) application, that enables enterprises to provide secure access to enterprise files and assets that reside on company servers and document repositories. mobilEcho for Good Dynamics is designed to provide enterprise security and manageability via the Good Dynamics platform. mobilEcho for Good Dynamics is for organizations that need end-to-end data protection and want the added value of maintaining control over the app and stored data on the mobile device.

mobilEcho for Good Dynamics has the same functionality of GroupLogic's standard mobilEcho application, but also allows users to take advantage of Good Dynamics' security features, including:

- All information (including files, thumbnails, and metadata like file names, comments, etc.) is encrypted with FIPS-certified encryption from end-to-end – on the device and in transit.
- The ability to securely separate personal and mobilEcho application data, respecting user privacy and supporting BYOD initiatives.
- Enterprise admins can set numerous policy requirements (such as who can use the mobilEcho for Good Dynamics application, which versions of the app and operating system can be used, and how long user passwords must be) and can revoke access to the app in real time.
- Access to the mobilEcho for Good Dynamics application and all related downloaded information can be remotely revoked or wiped entirely by IT, without disruption to the iOS device or personal data.

The mobilEcho for Good Dynamics client can be downloaded from the Apple App Store for free. The mobilEcho server application can be downloaded via the GroupLogic website (www.grouplogic.com) and is available as a 21 day free trial license with no restrictions.

GOOD DYNAMICS ARCHITECTURE

GOOD DYNAMICS SERVICES

SERVICE	DESCRIPTION
Push	Push communication between enterprise servers and mobile devices
Secure Communication	<ul style="list-style-type: none"> Two types of secure communication: socket calls (TCP/IP) and web services calls (HTTP/HTTPS) Standards-based encryption (ex. AES 192)
Secure Storage	Two types of secure storage: encrypted file system (encryption of file content and names) and encrypted SQLite DB standards-based encryption (ex. AES 192)
Management and Policies	<ul style="list-style-type: none"> Set policies for each application (ex. password length, copy/cut/paste permission, etc.) Manage every application (e.g., jail-breaking detection, application version enforcement, etc.)
Creation of Groups, Policies	<p>Initiate and secure user groups, application groups</p> <p>Apply policies at these levels</p>
